

NISS

**NISS
NETWORK AND INTERNET SECURITY
SOFTWARE**

USER MANUAL

How to use NISS Application?

There are two modules introduced in this demo:

- 1) Normal user Activity and
- 2) Admin Activity

1) Normal user Activity

- Please add following url in browser:
<http://localhost:8080/HT/>
- Above url will open first page. The page will have Register and Login option.
- Click on Register link. Registration page will be opened.
- Enter the required information in the fields given and click on **register** button. Thus user will be registered. There is one more button provided **Reset**. Clicking on Reset button will clear all text fields shown in the form.
- After registration one page will be opened saying that “your registration have been successfully created, please Click here and go to User Login! “. Click on the link provided.
- Admin Login page will be opened. But newly registered user will not be able to login. He will have to do IP settings from Administrator. Administrator will use following link for IP settings.
<http://localhost:8080/HT/Admin/FrmAdminLogin.html>

(Kindly view (ii) point in Admin Activity.)

- User login page will be opened. On User Login page there is a link provided “New Login”. Clicking on “new Login” link will open Registration page. Enter username and password in the fields given. Click on Login.
- After successful menu will be opened.
- If user wants to check theory files then click on Theory Menu and select a topic of which user want to read. Respective flash files will be opened. In this demo some pages are in working state. Tree menu is provided for navigation.
- If user wants to check animation files then click on Animation Menu and select a topic of which user want to read. Respective animation file will be opened. In this demo some pages are in working state. Tree menu is provided for navigation.
- If user wants simulate HTTP Technique then follow steps given below:

If User is logged in as a Hacker

- Click on Simulation->HTTP Technique.
- After clicking on **HTTP Technique** menu user will transferred to HTTP Hacking page. Enter Username in the textbox provided.

- Then click on '**Brute Force**' button. After clicking on **Brute Force** button, password Hacking process will start and it will give the intermediate steps followed in a table provided at right hand side.
- Use Reset button to clear the text written in the textboxes like username, password and match.
- After clicking on submit, HTTP hacking page will be opened. It will show HTTP hacking page. User will be able to see HTML pages available in particular user's folder. Click on "view" link to view the web page. It will show the contents of the page. There are two buttons provided "Edit Contents" and "Save Contents". Click on Edit Contents button to edit the web page that is opened. After editing click on Save Contents button to save the changes. To bring to notice for tracker that his file has been hacked and edited, all the text in <body> is displayed in RED color. This thing is done while saving the contents.
- There are two buttons provided. "Back" and "View Login History".
- After clicking on "Back" previous List of web pages will be displayed and after clicking on "View Login History" will display the log file generated for tracked user.

If User is logged in as a Tracker

Click on Simulation->HTTP Technique.

- After clicking on **HTTP Technique** menu user will transferred to HTTP Trackers page
- There are four buttons provided. "Manage Web Pages"," View Hacked Files"," Home" and "Logout".
- Manage web Pages button is for adding, editing and deleting web pages available for the particular user. After Clicking on manage web pages, the page with add, edit and delete buttons.
- Clicking on "Add" will open a web page using which user can add his pages. Add Title and Html code to be saved.
- Clicking on "Add" will open a web page using which user can add his pages. Add Title and Html code to be saved.
- Clicking on "Edit" will open a web page using which user can edit his pages. Select a page to be edited. The actual code of the file will be displayed. Just edit the code and click on "Update File" button. Clicking on "Home" button will open Settings page.
- Clicking on "Delete" will open a web page using which user can delete his pages. Click on delete link in front of the file to be deleted. Clicking on "Home" button will open Settings page.
- Clicking on " Back" button of Setting's page will be opened. Clicking on "Hacked View Files" will show if any Page is hacked. Otherwise it will display a message "**No Hacked Pages Found.**"
- Clicking on "Home" will open the menu page. And clicking on "Logout" will open main user login page.

- In main page of HTTP Hacking page, Click on view link of the page to be opened.
- It will show the selected page. Click on “edit Contents” button to edit the contents of the page and click “Save Contents” to save the edited contents.
- Click on “Logout” button to log out of the application.
- If user wants simulate FTP Technique then follow steps given below:
 - Enter the IP address of the PC where the FTP server is installed.
 - Enter the user account name which created on the FTP server.
 - Then apply FTP hacking for cracking password of FTP user account.
 - Now Brute-force is applied to crack the password on FTP server.
 - Now password is cracked and it will be displayed on the ‘Cracked Password’ text box.
 - Now you can do the activities such as uploading or downloading the files.
 - For downloading click on download.
 - Now you are in downloading page where you can see the list of files which are stored by the tracker on his account.
 - From the list you can select the file and download it.
 - For uploading click on upload button.
 - Where you can see the Browse option to select the file from your system and you can upload it to the tracker’s account.
 - After that you will get the uploaded status on the next page with FTP server responses.
 - Just analyze the responses from the server for better understanding of the FTP transfer sequences.
 - Now you can go to the FTP home page to see the activity details by click on the View Log file.
 - Where you can see the activities you done so far.

Tracker

Following are the steps to perform by Tracker side user.

- As you are tracker you assume that you have an account in FTP server and use the user account which is created by the administrator.
- Enter the IP address of the FTP server installed system.
- Enter the username and password of the FTP account.
- Click on Load for loading the values .Then Click on the connect button to connect the server.
- Now you are on the next page where you can see the list of files stored on the FTP server.
- Where you can see the details such as protection right of file, its size etc.
- If any hacker hacked your account and done any activities on it .it will be detected and show its status as “hacked”.
- So such files which are hacked will be showed on red colored rows.
- You can see the size of files which are changed by the hacker with time of hacking.

- On that page there is drop down list, from which you can select the file and click on download button. Save the file to your PC.
- For uploading click on upload button, it will direct you to the Uploading page.
- Where you can see the browse option and select the file for uploading.
- Then click on send button for upload and sending it to the FTP server.
- Now the file will be uploaded successfully and you can see the status of the file transferring and FTP Server responses.
- As FTP file transferring is done through different requests and responses we are showing that responses as Uploading status.
- If user wants to check Phishing Technique then click on Simulation->Phishing Technique.

Hacker

- First hacker will enter its username and password and click on submit button. It would be logged in its account.
- Hacker is now on new page where it will click on Go Activity link and it would be directed to a new page.
- Hacker will select simulation menu item on menu bar and select submenu item Phishing technique under simulation submenu item, now we would have Hacker submenu item under Phishing technique submenu item and click on Hacker submenu item. We would be directed to a new page Hacker Phishing Technique.
- In Hacker Phishing technique page hacker would enter its user name and password and click on Submit button. Then hacker would be directed to its mailing page.
- Hacker clicks on Compose (mail) link of mailing page now it can compose message for a tracker whom it wants to hack.
- Now hacker selects fake site of a bank from drop down combo, enter the name of tracker in the To edit box whom it wants to send the message and click on send button. Now the tracker will receive the message.

Tracker

- First tracker will enter its username and password and click on submit button. It would be logged in its account.
- Tracker is now on new page where it will click on Go Activity link and it would be directed to a new page.
- Tracker will select simulation menu item on menu bar and select submenu item Phishing technique under simulation submenu item, now it would have Tracker submenu item under Phishing technique submenu item and clicks on Tracker submenu item. We would be directed to a new page Tracker Phishing Technique.
- In Tracker Phishing technique page tracker would enter its user name and password and click on Submit button. Then tracker would be directed to its mailing page.

- Tracker clicks on Inbox link of mailing page now it can view received message from the hacker who wants to hack the tracker and it is directed to Phishing Inbox page.
- Tracker clicks on link under mail subject column of the Inbox table, now tracker is directed to the Inbox Message page and can read the message. Now tracker clicks on the link of the message sent by hacker and it is directed to the fake site of the bank received in message as a link.
- Now the tracker enters user id and password for Internet Banking in the fake site of the bank and clicks on the login button. Now messages “This is fake site of the bank” and “Hi! Your user id and password has been hacked with entered user id and password” are popped up. When tracker clicks on ok button of the last pop up message then it is directed to original site of the bank with pop up message Showing that this original site of the bank .Now details of the user id and password entered by the tracker would be sent to the hacker and hacker can see this information by logging in its own account and checking its Inbox.
- If user wants simulate Spy ware Technique then follow steps given below:

Hacker

- First hacker will enter its username and password and click on submit button. It would be logged in its account.
- Hacker is now on new page where it will click on Go Activity link and it would be directed to a new page.
- Hacker will select simulation menu item on menu bar and select submenu item spy ware technique under simulation submenu item, now we would have Hacker submenu item under spy ware technique submenu item and click on Hacker submenu item. We would be directed to a new page spy ware hacking.
- In Spy ware hacking page hacker would enter user name of a tracker whom it wants to crack password and click on Brute Force button. Now hacker gets password of the tracker and click on submit button then hacker would be directed to upload spy ware page.
- Hacker clicks on upload spy ware button then spy ware is uploaded on tracker’s folder.

Tracker

- First tracker will enter its username and password and click on submit button. It would be logged in its account.
- Tracker is now on new page where it will click on Go Activity link and it would be directed to a new page.
- Tracker will select simulation menu item on menu bar and select submenu item spy ware technique under simulation submenu item, now we would

have tracker submenu item under spy ware technique submenu item and click on

- Tracker submenu item. We would be directed to a new page download spy ware.
- Tracker clicks on download spy ware button after that clicks on open button then spy ware is activated on tracker's
- System.Spyware sends tracker's system information to the hacker.
- If user wants simulate Software Technique then follow steps given below:

Hacker

- First hacker will enter its username and password and click on submit button. It would be logged in its account.
- Hacker is now on new page where it will click on Go Activity link and it would be directed to a new page.
- Hacker will select simulation menu item on menu bar and select submenu item software under simulation submenu item, now we would have Hacker submenu item under software submenu item and click on Hacker submenu item. We would be directed to a new page software hacking.
- In software hacking page hacker would enter user name of a tracker whom it wants to crack password and click on Brute Force button. Now hacker gets password of the tracker and click on submit button then hacker would be directed to upload software page.
- Hacker selects software file from drop down menu and clicks on upload button then software is uploaded on tracker's folder.

Tracker

- First tracker will enter its username and password and click on submit button. It would be logged in its account.
- Tracker is now on new page where it will click on Go Activity link and it would be directed to a new page.
- Tracker will select simulation menu item on menu bar and select submenu item software under simulation submenu item, now we would have tracker submenu item under software submenu item and click on tracker submenu item. We would be directed to new page download software.
- Tracker selects file from drop down on download spy ware button after that clicks on open button then software is activated on tracker's System. Software sends tracker's system information to the hacker.

If user wants simulate Virus Technique then follow steps given below:

Attacker (Hacker)

Here we show the e-mail virus attack. So attacker will send a malicious e-mail to a victim who doesn't have much protection on his system. Here we showing a scenario such that you are logged to a email account by the name of your tracker

- Username and Password. Here assumed that you have an account in the 'Falcon Mail'.
- You have done sign in and entered the e-mail account. Now you are in a page where its have option for compose the message click on it. Now you are on compose message page here you can upload the viruses which are given there.
- Select any viruses from the drop down list Viz select Viruses .Then select a subject as the subject of message. Then in to address enter the username of any tracker who exists.
- You can send the message to the victim (tracker).You send the message successfully.

Victim (Tracker)

In Victim side you can see two types of virus attack.

- i) Attack from unwanted sites.
- ii) E-mail virus.

i) Attack from unwanted sites

- In this we are showing a scenario where its have a internet browser by the name of "Falcon Internet Explorer", where can enter the addresses of any sites (type like this 'http://www.falconindia.biz') .After some tries you will get a pop up window of a Falcon Mail.
- You should download that file to your system. This the virus file .You should double click for its activation as this is only for education purpose.
- After that if you try any sites on Falcon Internet Explorer you will get different anomalous responses.
- That means virus is getting activated.
Note: After the experiment please delete that files From your system.

ii) E-mail Virus

To do the E-mail virus experiment click the button "falcon Mail" Falcon Internet Explorer page.

- Now you are on Falcon Mail e-mail's Login page.
- Enter your tracker user name and password for sign in.
- Now You logged on to the e-mail account.
- There you can see options like Inbox, Delete Messages etc.
- Click on Inbox to see the incoming messages.
- On this page you can see the messages send by others to your account.
- These messages are e-mail viruses either send by the attacker or forwarded by other victims.
- So if you click on it you will download the corresponding virus on your system.

- The same time that mail will be forwarded to other trackers.
- You are downloading two types of viruses here
 - a. Shut Down Your PC.
 - b. It will delete any folder on your desktop with name "falcon".
- To activate this file please double click on it as this is only for education purpose.
- To see details about the activities you have done in this module look at the log file.
In this demo has partially implemented functionality.
Full fledge functionality will be added in next version.

2) Admin Activity

- Please add following url in browser:
<http://localhost:8080/HT/Admin/FrmAdminLogin.html>
- Above url will open Admin activity page. There are three options in combo box provided:
 - Phishing Technique
 - Admin Records
 - User Records and three buttons named Add, Edit and Delete.
- i) **Phishing technique:**
 - Select Phishing technique, after clicking on **Add** button **Add Record for Phishing Technique** page will be opened.
 - Add Title and Title code in the fields given Click on Add button.
 - This will add the contents in Hacker's Phishing database.
 - Successful addition will show the message saying
 - **"Your record has been added successfully".**
- Click on **"Home"** link. **"Admin Activity"** page will be displayed.
 - Select Phishing technique, after clicking on **Edit** button, "Phishing Technique Records" will be opened. It will show old records as links.
 - After clicking on link "Edit Record for Phishing Technique" page will be opened.
 - It will add selected Link's name in Title field and
 - And the code is displayed in Title code field. Make changes in the code displayed in Title code field and
- Click **Update** Button.
 - Click on Home link and you will be transferred to **"Admin Activity"** page again.
 - Select "Phishing Technique" and click on "Delete" button if Admin wants to delete some records.
 - After clicking Delete option "Phishing Technique Records" page will be opened. This page will have available records with delete link. Click on delete of the page Admin wants to delete. After clicking the link respective record will be deleted.

- Again Click on Home link. User will be transferred to “Admin Activity” page.
- The functionality for Admin Records and User Records is not implemented yet. Selecting these options will show sample page.

ii) IP Settings

- Select Setting IP Address option in the combo box provided. Click on Add button to set IP address and State (i.e. Hacker/Tracker) to newly registered user.

Clicking Add button will open a web page containing list of User Name. IP Addresses and User Type available. Select newly registered user from the first combo box. Set IP address to him and User type. Each setting for user should be unique. I.e. IP address that is assigned to one user cant be repeated for another user. Click on Submit button and thus the user will be added in the list. All the setting done for users can be viewed in the table shown in the page. Click on “**Start I-SECURE**” link.

- On clicking this link one page will be displayed having links” **Register**” and” **Login**”. Click on “**Login**” and user will be able to login in his account.

Sample User Login:

User Name	Password
Hack	ha
Track	tr
x	x
g	g

Sample admin Login

User name	Password
admin	a
falcon	f
